The book aims to provide an introduction to mathematical models that describe the dynamics of tumor growth and the evolution of tumor cells. It can be used as a textbook for advanced undergraduate or graduate courses, and also serves as a reference book for researchers. The book has a strong evolutionary component and reflects the viewpoint that cancer can be understood rationally through a combination of mathematical and biological tools. It can be used both by mathematicians and biologists. Mathematically, the book starts with relatively simple ordinary differential equation models, and subsequently explores more complex stochastic and spatial models. Biologically, the book starts with explorations of the basic dynamics of tumor growth, including competitive interactions among cells, and subsequently moves on to the evolutionary dynamics of cancer cells, including scenarios of cancer initiation, progression, and treatment. The book finishes with a discussion of advanced topics, which describe how some of the mathematical concepts can be used to gain insights into a variety of questions, such as epigenetics, telomeres, gene therapy,

and social interactions of cancer cells. Contents: Teaching Guide Cancer and Somatic Evolution Mathematical Modeling of Tumorigenesis Basic Growth Dynamics and Deterministic Models: Single Species Growth Two-Species Competition Dynamics Competition Between Genetically Stable and Unstable Cells Chromosomal Instability and Tumor Growth Angiogenesis Inhibitors, Promoters, and Spatial Growth Evolutionary Dynamics and Stochastic Models: Evolutionary Dynamics of Tumor Initiation Through Oncogenes: The Gain-of-Function Model Evolutionary Dynamics of Tumor Initiation Through Tumor-Suppressor Genes: The Loss-of-Function Model and Stochastic Tunneling Microsatellite and Chromosomal Instability in Sporadic and Familial Colorectal Cancers Evolutionary Dynamics in Hierarchical Populations Spatial Evolutionary Dynamics of Tumor Initiation Complex Tumor Dynamics in Space Stochastic Modeling of Cellular Growth, Treatment, and Resistance Generation Evolutionary Dynamics of Drug Resistance in Chronic Myeloid Leukemia Advanced Topics: Evolutionary Dynamics of Stem-Cell Driven Tumor Growth Tumor Growth Kinetics and Disease Progression Epigenetic Changes and the Rate of DNA Methylation Telomeres and Cancer Protection Gene Therapy and Oncolytic Virus Therapy Immune Responses, Tumor Growth, and Therapies Towards Higher Complexities: Social Interactions

Readership: Researchers in mathematical biology, mathematical modeling, biology, mathematical oncology.

Keywords: Mathematical

Oncology; Dynamics; Evolution; Evolutionary

Dynamics; Cancer; Mathematical Models; Somatic

Evolution; Teaching Key Features: Both a reference book for the

topic, and provides material for undergraduate and graduate

courses Tries to bridge the divide between mathematicians and

biologists, which is also reflected in the backgrounds of the two

authors Shows how mathematical concepts can be translated into

experimentally and clinically useful insights Rooted in evolutionary

biology, the book handles this very complex phenomenon in an intuitive and mathematically elegant way. Contains problems and research projects for each topic. 10 pages of figures in color.

This edition of the World Bank has been revised and expanded by the Terminology Unit in the Languages Services Division of the World Bank in collaboration with the English, Spanish, and French Translation Sections. The Glossary is intended to assist the Bank's translators and interpreters, other Bank staff using French and Spanish in their work, and free-lance translator's and interpreters employed by the Bank. For this reason, the Glossary contains not only financial and economic terminology and terms relating to the Bank's procedures and practices, but also terms that frequently occur in Bank documents, and others for which the Bank has a preferred equivalent. Although many of these terms, relating to such fields as agriculture, education, energy, housing, law, technology, and transportation, could be found in other sources, they have been assembled here for ease of reference. A list of acronyms occurring frequently in Bank texts (the terms to which they refer being found in the Glossary) and a list of international, regional, and national organizations will be found at the end of the Glossary.

This book presents case-based reasoning in a systematic approach with two goals: to present rigorous and formally valid structures for precise case-based reasoning, and to demonstrate the range of techniques, methods, and tools available for many applications.

In this book, leading scientists in the fields of sensory biology, neuroscience, physics and engineering explore the basic operational principles and behavioral uses of flow sensing in animals and how they might be applied to engineering applications such as autonomous control of underwater or aerial vehicles. Although humans possess no flow-sensing abilities, countless aquatic (e.g. fish, cephalopods and seals), terrestrial (e.g. crickets and spiders) and

aerial (e.g. bats) animals have flow sensing abilities that underlie remarkable behavioral feats. These include the ability to follow silent hydrodynamic trails long after the trailblazer has left the scene, to form hydrodynamic images of their environment in total darkness, and to swim or fly efficiently and effortlessly in the face of destabilizing currents and winds.
