Paper was invented around the year 100 a.d. and was soon adapted for use in kites. Kitemaking soon spread from China to Japan, Korea, Burma (now, Myanmar), and Malaysia, regions where kite flying is still an important part of the local culture. From there it spread to Indonesia, India, and the islands of the Pacific.

This book provides in-depth coverage of the latest research and development activities concerning innovative wind energy technologies intended to replace fossil fuels on an economical basis. A characteristic feature of the various conversion concepts discussed is the use of tethered flying devices to substantially reduce the material consumption per installed unit and to access wind energy at higher altitudes, where the wind is more consistent. The introductory chapter describes the emergence and economic dimension of airborne wind energy. Focusing on “Fundamentals, Modeling & Simulation”, Part I includes six contributions that describe quasi-steady as well as dynamic models and simulations of airborne wind energy systems or individual components. Shifting the spotlight to “Control, Optimization & Flight State Measurement”, Part II combines one chapter on measurement techniques with five chapters on control of kite and ground stations, and two chapters on optimization. Part III on “Concept Design & Analysis” includes three chapters that present and analyze novel harvesting concepts as well as two chapters on system component design. Part IV, which centers on “Implemented Concepts”, presents five chapters on established system concepts and one chapter about a subsystem for automatic launching and landing of kites. In closing, Part V focuses with four chapters on “Technology Deployment” related to market and financing strategies, as well as on regulation and the environment. The book builds on the success of the first volume “Airborne Wind Energy” (Springer, 2013), and offers a self-contained reference guide for researchers, scientists, professionals and students. The respective chapters were contributed by a broad variety of authors: academics, practicing engineers and inventors, all of whom are experts in their respective fields.

A study guide that matches the Edexcel specification to help students succeed at A Level, this volume examines graphics within materials technology and is intended to aid revision as well as study.

“These kites are truly works of art.”—Library Journal. “This book’s best feature are the designs for 19 kites. Each project is illustrated with a line drawing on a grid, along with a full-page, full-color photograph in which the intense hues and contrasts are highlighted, adding to the stunning results. The originality and beauty of the kites and the excellent instructions make it an attractive book that will inspire kite lovers.”—School Library Journal.

This Edition of General English & Comprehension English book has been made to meet the requirements of candidates appearing in SSC-CGL (Tier-I). This volume covers the previous years questions of SSC-CGL of the last three years (2017-2019) including of latest conduct exam of SSC-CGL 2019 held in March’2020, so that students may understand the latest approach of framing the questions by Commission. River basins are complex areas, combining the natural processes of precipitation, evapotranspiration, surface water and groundwater runoff with man-made features such as dams and reservoirs, diversions and irrigation schemes, and industrial and urban water uses. Computer models may be constructed to represent these natural and man-made processes. Such models are used to help understand processes that are difficult to measure (such as evaporation) and to study the effects of changes in land cover, water management or climate on the natural and man-made processes.
