The modern materialist approach to life has conspicuously failed to explain such central mind-related features of our world as consciousness, intentionality, meaning, and value. This failure to account for something so integral to nature as mind, argues philosopher Thomas Nagel, is a major problem, threatening to unravel the entire naturalistic world picture, extending to biology, evolutionary theory, and cosmology. Since minds are features of biological systems that have developed through evolution, the standard materialist version of evolutionary biology is fundamentally incomplete. And the cosmological history that led to the origin of life and the coming into existence of the conditions for evolution cannot be a merely materialist history, either. An adequate conception of nature would have to explain the appearance in the universe of materially irreducible conscious minds, as such. Nagel's skepticism is not based on religious belief or on a belief in any definite alternative. In *Mind and Cosmos*, he does suggest that if the materialist account is wrong, then principles of a different kind may also be at work in the history of nature, principles of the growth of order that are in their logical form teleological rather than mechanistic. In spite of the great achievements of the physical sciences, reductive materialism is a world view ripe for displacement. Nagel shows that to recognize its limits is the first step in looking for alternatives, or at least in being open to their possibility.

Gregory Bateson was a philosopher, anthropologist, photographer, naturalist, and poet, as well as the husband and collaborator of Margaret Mead. This classic anthology of his major work includes a new Foreword by his daughter, Mary Katherine Bateson. 5 line drawings.

How did humans acquire cognitive capacities far more powerful than any hunting-and-gathering primate needed to survive? Alfred Russel Wallace, co-founder with Darwin of evolutionary theory, set humans outside normal evolution. Darwin thought use of language might have shaped our sophisticated brains, but this remained an intriguing guess--until now. Combining state-of-the-art research with forty years of writing and thinking about language origins, Derek Bickerton convincingly resolves a crucial problem that biology and the cognitive sciences have systematically avoided. Before language or advanced cognition could be born, humans had to escape the prison of the here and now in which animal thinking and communication were both trapped. Then the brain's self-organization, triggered by words, assembled mechanisms that could link not only words but the concepts those words symbolized--a process that had to be under conscious control. Those mechanisms could be used equally for thinking and

for talking, but the skeletal structures they produced were suboptimal for the hearer and had to be elaborated. Starting from humankind's remotest past, *More than Nature Needs* transcends nativist thesis and empiricist antithesis by presenting a revolutionary synthesis that shows specifically and in a principled way how and why the synthesis came about.

Examines the emergent processes that bridge the gap between organisms that think and have consciousness and those that do not and discusses the origins of life, information, and free will.

First published in 2000. Routledge is an imprint of Taylor & Francis, an informa company.

Brian Leftow offers a theist theory of necessity and possibility, and a new sort of argument for God's existence. He argues that necessities of logic and mathematics are determined by God's nature, but that it is events in God's mind - His imagination and choice - that account for necessary truths about concrete creatures.
