Nutrition for Developing Countries is both a textbook of nutrition - covering the essential facts about nutrients, nutrient needs, foods, ane meals - and at the same time a practical guide for nutrition workers - be they health workers, agricultural workers, home economists, or school teachers - or their trainers. It explains in clear simple language, and practical detail, how nutrition workers can help families with nutrition problems, how to treat malnourished children, and how to work in communities, and in schools. This information is not easily available elsewhere, and no other manual covers the subject so comprehensively. The manual is liberty illustrated, with many new drawings, as well as some from the old edition of the book. This new edition of a popular and widely-used book brings the subject up-to-date, and takes it to a slightly more advanced level, and includes new ideas on working in and with communities, and about nutrition education. It includes many ideas for exercises for training nutrition workers. Nutrition for Developing Countries fills the role of the first edition, and retains its simple approach, but covers the subject in greater depth and more widely.

Nutrition is an essential component of the work of all health and community workers, including those involved in humanitarian assistance, and yet it is often neglected in their basic training. Drawn from the experiences of an international editor team with extensive field experience, Nutrition for Developing Countries brings together the essential basics of nutrition in an easily accessible form which is accurate, up-to-date and practical, and suitable for a wide range of readers at different levels. The book covers the whole life cycle, including pregnancy, breastfeeding, complementary feeding, older children, adolescents, adults and the elderly, with an emphasis on the most vulnerable women and children. The fully revised and updated edition addresses both the long standing problems of undernutrition and malnutrition, and the growing epidemic of overnutrition and obesity, which are responsible for the rapid increase in non-communicable diseases of later life. Generously illustrated, Nutrition for Developing Countries explains in clear simple language, and practical detail, how nutrition workers can help families with nutrition problems, including many ideas for exercises for training nutrition workers.

Nutrition textbooks used by universities and colleges in developing countries have very often been written by scholars who live and work in North America or the United Kingdom. And while the research and information they present is sound, the nutrition-related health challenges with which developing countries must grapple differ considerably from those found in highly industrialized Western nations. The primary aim of Community Nutrition for Developing Countries is to provide a book that meets the needs of nutritionists and other health professionals living and working in developing countries. Written by both scholars and practitioners, the volume draws on their wealth of knowledge, experience, and understanding of nutrition in developing countries to provide nutrition professionals with all the information they require. Each chapter addresses a specific nutrition challenge currently faced by developing countries such as food security, food safety, disease prevention, maternal health, and effective nutrition policy. In addition, the volume serves as an invaluable resource for those developing and implementing nutrition education programmes. With an emphasis on nutritional education as a means to prevent disease and effectively manage health disorders, it

is the hope of the nearly three dozen contributors to this work that it will enhance the health and well-being of low-income populations throughout the world.

This updated and expanded book was written with the underlying conviction that global health and nutrition problems can only be solved through a firm understanding of the different levels of causality and the interactions between the various determinants. This volume provides policy makers, nutritionists, students, scientists, and professionals with the most recent and up-to-date knowledge regarding major health and nutritional problems in developing countries.

The book presents an update on public health and nutrition problems of developing countries with a description of approaches used and efficiency of trials undertaken for addressing these. Additionally, it highlights the experiences emerging from up-scaling intervention programme planning and implementation.

This third edition reviews the epidemiology, policies, programs and outcome indicators that are used to determine improvements in nutrition and health that lead to development. This greatly expanded third edition provides policy makers, nutritionists, students, scientists, and professionals with the most recent and up-to-date knowledge regarding major health and nutritional problems in developing countries. Policies and programs that address the social and economic determinants of nutrition and health are now gaining in importance as methods to improve the status of the most vulnerable people in the world. This volume provides the most current research and strategies so that policy makers, program managers, researchers and students have knowledge and resources that they can use to advance methods for improving the public ' s health and the development of nations. The third edition of Nutrition and Health in Developing Countries takes on a new context where the word " developing " is now a verb and not an adjective.

In this publication, Professor Michael Latham draws upon his far-reaching experience in the field of international nutrition to provide a rich source of information about nutrition science, public health, food science and public policy. The text summarizes key points in human nutrition and provides information about protein, fats, carbohydrates, minerals and vitamins. Special emphasis is given to the nutritional needs of infants, children, mothers and the elderly. Basic information about foods commonly found in the diets of Africans, Asians and Latin Americans is given. The book focuses on the nutritional and health consequences of inadequate food consumption. Each major nutritional disorder is described and factors contributing to malnutrition such as low food production, food insecurity, poor health status and social and cultural factors are reviewed. [This is a reprint of the 1997 edition.]

During the last decade the food and nutrition situation in developing countries has changed dramatically. For better or worse, urbanization and globalization have altered the diet and nutrition in both rural and urban areas. In many developing countries a persistent level of under nutrition exists both in rural areas and in urban slums due to less access to food needed for an active and healthy life. On the other hand, over-nutrition, or eating too much, has emerged among the middle-income groups. It is essential to have a better understanding of how people deal with their food in developing countries, in order to plan and implement food and nutrition programmes. This manual deals with the process of changing food habits and consumption patterns in developing countries. Nutritional implications, together with practical information is discussed in relationship to conducting field surveys. Part one of the manual provides insight into the dynamics of food habits and consumption and its socio-economic and cultural dimensions. Part two gives practical information on small scale surveys to be carried out within the framework of a nutrition issue, including data collecting on food habits and the measurement of food intake. This manual addresses professionals with practical or academic training and those who are involved in various types of food and nutrition programmes or related activities. It can also be used as a handbook in food and nutrition training courses at higher and at academic level.
