Designing structures to withstand the effects of fire is

challenging, and requires a series of complex design decisions. This third edition of Fire Safety Engineering Design of Structures provides practising fire safety engineers with the tools to design structures to withstand fires. This text details standard industry design decisions, and offers expert design advice, with relevant historical data. It includes extensive data on materials' behaviour and modeling -- concrete, steel, composite steel-concrete, timber, masonry, and aluminium. While weighted to the fire sections of the Eurocodes, this book also includes historical data to allow older structures to be assessed. It extensively covers fire damage investigation, and includes as far back as possible, the background to code methods to enable the engineer to better understand why certain procedures are adopted. What's new in the Third Edition? An overview in the first chapter explains the types of design decisions required for optimum fire performance of a structure, and demonstrates the effect of temperature rise on structural performance of structural elements. It extends the sections on less common engineering materials. The section on computer modelling now includes material on coupled heat and mass transfer, enabling a better understanding of the phenomenon of spalling in concrete. It includes a series of worked examples, and provides an extensive reference section. Readers require a working knowledge of structural mechanics and methods of structural design at ambient conditions, and are helped by some understanding of thermodynamics of heat transfer. This book serves as a resource for engineers working in the field of fire safety, consultants who regularly carry out full fire

state-of-the-art review on the evolution of the subject. The first edition was a landmark study which examined how event research had evolved and developed from a range of different social science subject areas and disciplines. The Handbook was the first critique of the extent to which the subject had developed into a major area of social science inquiry. This second edition has been fully updated to reflect crucial developments in the field and includes brand new sections on ever-important aspects of Event Studies such as: anthropology, hospitality, seasonality, knowledge management, accessibility, diversity and human rights, as well as new studies on 'the eventful city' and the benefits of events in older life. The book is divided into four inter-related sections. Section 1 introduces and evaluates the concept of events. Section 2 critically reviews the relationship between events and other disciplines such as the contribution of economics, psychology and geography to the critical discourse of Event Studies. Section 3 focuses on the business, operational and strategic management of events, while the final section crucially focuses on critical events as a new paradigm within the burgeoning literature on Events. It offers the reader a comprehensive and critical synthesis of this field, conveying the latest thinking associated with events research, edited by two of the leading scholars in the field. The text will provide an invaluable resource for all those with an interest in Events Studies, encouraging dialogue that will span across disciplinary boundaries and other areas of study.
